FALL is a good time to plant Clematis because soil conditions are ideal at this season. Set the plant carefully in place without breaking the ball of soil. If the plant is received bare, spread the roots carefully, setting the crown at least 2 inches below the surface. Firm the soil well around the roots and tie the canes to a small stake for support. A 4-inch tile or wire collar may be used as a protective measure around the neck of the plant while setting it out. Hill the soil well up around the roots to a height of 6 inches as winter protection. Mulch with straw or leaves when winter arrives.

ADVANTAGES OF FALL PLANTING

The soil is in best condition for planting.

The plants will make an earlier start the next spring.

Larger vines and more bloom will be produced the following summer.
